QUBIT COACHING | CHAPTER REVISION WORKBOOK
Physics: Laws of motion

1. Identify the body and draw all external forces.
2. Choose coordinate axes and state your sign convention.
3. Write Newton’s second law for each relevant direction.
4. Check units, assumptions and the reasonableness of your answer.

Worked example:
A 2 kg object has a net acceleration of 3 m/s squared.
Net external force = mass x acceleration = 6 newtons.

Your practice:
What is given?
What do you need to find?
Which law or relationship will you use?
Draw a diagram and explain the assumptions.

This is sample revision content for the Qubit coaching prototype.
Your faculty can upload the complete chapter resources.
